Describes the production and properties of fibrous materials, including important advances in the manufacture of high stiffness and high strength fibres. This book is designed to provide lecture notes (theory) and experimental design of major concepts typically taught in most Mechanics of Materials courses in a sophomore- or junior-level Mechanical or Civil Engineering curriculum. Several essential concepts that engineers encounter in practice, such as statistical data treatment, uncertainty analysis, and Monte Carlo simulations, are incorporated into the experiments where applicable, and will become integral to each laboratory assignment. Use of common strain (stress) measurement techniques, such as strain gages, are emphasized. Application of basic electrical circuits, such as Wheatstone bridge for strain measurement, and use of load cells, accelerometers, etc., are employed in experiments. Stress analysis under commonly applied loads such as axial loading (compression and tension), shear loading, flexural loading (cantilever and four-point bending), impact loading, adhesive strength, creep, etc., are covered. LabVIEW software with relevant data acquisition (DAQ) system is used for all experiments. Two final projects each spanning 2–3 weeks are included: (i) flexural loading with stress intensity factor determination and (ii) dynamic stress wave propagation in a slender rod and determination of the stress–strain curves at high strain rates. The book provides theoretical concepts that are pertinent to each laboratory experiment and prelab assignment that a student should complete to prepare for the laboratory. Instructions for securing off-the-shelf components to design each experiment and their assembly (with figures) are provided. Calibration procedure is emphasized whenever students assemble components or design experiments. Detailed instructions for conducting experiments and table format for data gathering are provided. Each lab assignment has a set of questions to be answered upon completion of experiment and data analysis. Lecture notes provide detailed instructions on how to use LabVIEW software for data gathering during the experiment and conduct data analysis. This book presents in a very concise form the entire undergraduate syllabus in the subject of materials science as specified by most Universities for students studying for degree courses in mechanical, production and materials engineering. No existing text adequately covers the breadth and depth as required by the syllabus. Moreover, the subject matter falls into two distinct categories: the phenomenological and the mechanistic. Available textbooks that give excellent treatment to one category of topics inevitably give only a superficial treatment to the other category. The Author seeks to bridge this gap, while offering students an affordable revision text. Materials science concerns itself with relating the internal structure of a material to its properties, and further seeks to enable the engineer to arrive at a defined set of properties through manipulation of this internal structure. This book has been arranged with this need in mind. Thus, the first three chapters deal with the internal structure of the three primary classes of materials i.e., metals, polymers and ceramics. The next chapter deals with the mechanical properties. The following chapter is on "equilibrium diagrams" that is necessary for the understanding of metallic alloy systems. In the next three chapters the properties of iron, aluminium, copper and titanium based alloys are explained and ways of improving the said properties (alloying, heat treatment, and processing) expounded on. In the following three chapters, attention is focused on the more specialized material properties i.e., fatigue, creep and fracture. Polymers, ceramics and composites are then considered. In all cases, the internal structures are considered followed by the properties and finally some brief mention of

the major processing methods for each group. Finally, some aspects of surface stability are touched on in the chapter on corrosion and degradation of materials. Throughout this book, illustrations have been used liberally to help amplify the theory. Where applicable, worked examples of numerical problems have been provided. At the end of each chapter, un-worked problems are given (with answers to numerical problems). These questions are adopted mainly from past University examination papers. Two or three books recommended for further reading on each topic are given at the end of each chapter. • Best Selling Note Book for GATE Mechanical Engineering Exam in English with objective-type questions as per the latest syllabus. • Increase your chances of selection by 16X. • GATE Mechanical Engineering Notes Book comes with well-structured Content & Chapter wise Practice Tests for your self-evaluation • Clear exam with good grades using thoroughly Researched Content by experts.
