The key to understanding men is in understanding how they relate to their gadgets. Just because they may seem to show more interest in their computers...or their remote controls...or their fancy watches or their power mowers or their stereos...doesn't mean that their toys are really the most important things in their life. In Boys and Their Toys, bestselling author Bill Adler, Jr. explains how men use toys to assert their independence and freedom, relieve stress, connect to their lost childhood, and even express their nurturing side (without having to admit it). Written in Adler's fun, humorous style, the book reveals how women can:

- * learn how a man's interest in particular "toys" can be used to predict his behavior*
- * know when a guy's passion for gadgets crosses the line into obsession and what to do about it*
- * take advantage of the human-gadget relationship to improve the human-human relationship.*

Smart and funny, Boys and Their Toys helps readers understand what makes their men tick...and grow closer with them in the process. Trends in Diphtheria Research Provides business profiles, hiring and workplace culture information at more than 40 top employers including such businesses as Microsoft. This book focuses on the materials used for fuel cells, solar panels, and storage devices, such as rechargeable batteries. Fuel cell devices, such as direct methanol fuel cells, direct ethanol fuel cells, direct urea fuel cells, as well as biological

fuel cells and the electrolytes, membranes, and catalysts used there are detailed. Separate chapters are devoted to polymer electrode materials and membranes. With regard to solar cells, the types of solar cells are detailed, such as inorganic-organic hybrid solar cells, solar powered biological fuel cells, heterojunction cells, multi-junction cells, and others. Also, the fabrication methods are described. Further, the electrolytes, membranes, and catalysts used there are detailed. The section that is dealing with rechargeable batteries explains the types of rechargeable devices, such as aluminum-based batteries, zinc batteries, magnesium batteries, and lithium batteries. Materials that are used for cathodes, anodes and electrolytes are detailed. The text focuses on the basic issues and also the literature of the past decade. Beyond education, this book may serve the needs of polymer specialists as well as other specialists, e.g., materials scientists, electrochemical engineers, etc., who have only a passing knowledge of these issues, but need to know more.

Over the past 5 years, clinical immunology, as a whole, has advanced more rapidly than over the past 20 years. Many of these advances have been due to monoclonal antibody technology with its ability to identify antigens on tumour cells with a precision never before available. Monoclonal antibodies have the ability to identify subsets of human T-lymphocytes and aid in diagnosis of both immunodeficiency disorders such as AIDS, or autoimmune diseases, and they can be adapted as drug targeting agents. Additionally, however, major advances have been made in identifying immunomodulating agents, and the last year has seen two such agents, IL-2 and OKT3, made available commercially for such intervention. Furthermore, another immunomodulating technique, bone marrow transplantation, has now been established as a curative modality in leukaemia treatment. A central issue in tumour immunology is whether human tumours express antigens which can be termed tumour-specific. This has important implications for both tumour immunity as well as drug targeting. This issue is considered in detail by R. A. Robins in the introductory chapter in which the expression of antigens in human tumours is compared with that in experimentally induced animal tumours. This controversial issue is also considered in later chapters by Bast in breast carcinoma, Riimke and de Vries in melanoma, V{mky in lung cancer, Armitage in colorectal cancer, and Paulie and Perlmann in bladder carcinoma. This book stages a timely

discussion about the centrality of identity politics to theatre and performance studies. It acknowledges the important close relationship between the discourses and practices historically while maintaining that theatre and performance can enlighten ways of being with others that are not limited by conventional identitarian languages. The essays engage contemporary theatre and performance practices that pose challenging questions about identity, as well as subjectivity, relationality, and the politics of aesthetics, responding to neo-liberal constructions and exploitations of identity by seeking to discern, describe, or imagine a new political subject. Chapters by leading international scholars look to visual arts practice, digital culture, music, public events, experimental theatre, and performance to investigate questions about representation, metaphysics, and politics. The collection seeks to foreground shared, universalist connections that unite rather than divide, visiting metaphysical questions of being and becoming, and the possibilities of producing alternate realities and relationalities. The book asks what is at stake in thinking about a subject, a time, a place, and a performing arts practice that would come 'after' identity, and explores how theatre and performance pose and interrogate these questions. This series, edited by J. Tooze (as of Volume 26), provides a comprehensive survey of the present state and future developments in well-defined areas in oncology. Each issue deals with a specific topic and has guest editors with an expert knowledge of the subject. After the President is diagnosed with a neurological disorder, his relative Tim Sullivan, a partner of a fertility clinic, disappears and begins intensive genetic research while his partner experiments with cloning. This volume provides the reader with an overview of the diverse functions of the RUNX family of genes. As highlighted in the introduction and several of the 29 chapters, humans and other mammals have three RUNX genes that are known to play specific roles in blood, bone and neuronal development. However, their evolutionary history has recently been traced back to unicellular organisms and their involvement in many well-known signaling pathways (Wnt, TGF β , Notch, Hippo) is indicative of a more general function in cell biology. Their documented roles in cell fate decisions include control of proliferation, differentiation, survival, senescence and autophagy. The pleiotropic effects of RUNX in development are mirrored in cancer, where RUNX genes can function as oncogenes that collaborate strongly with Myc family oncogenes or as tumour suppressor genes. In the latter role, they display hallmarks of both 'gatekeepers' that modulate p53 responses and 'caretakers' that protect the genome from DNA damage. Several chapters focus on the importance of these genes in leukemia research, where RUNX1 and C/EBP β are frequently affected by chromosomal translocations that generate fusion oncoproteins, while recent studies suggest wider roles for RUNX modulation in solid cancers. Moreover, RUNX genes are intimately involved in the development and regulation of the immune system, while emerging evidence suggests a role in innate immunity to

infectious agents, including HIV. At the biochemical level, the RUNX family can serve as activators or repressors of transcription and as stable mediators of epigenetic memory through mitosis. Not surprisingly, RUNX activity is controlled at multiple levels, this includes miRNAs and a plethora of post-translational modifications. Several chapters highlight the interplay between the three mammalian RUNX genes, where cross-talk and partial functional redundancies are evident. Finally, structural analysis of the RUNX/CBFB interaction has led to the development of small molecule inhibitors that provide exciting new tools to decipher the roles of RUNX in development and as targets for therapy. This volume provides a compendium and reference source that will be of broad interest to cancer researchers, developmental biologists and immunologists. Receptors and Hormone Action, Volume III, is part of a multivolume series that summarizes advances in the field of hormone action. The articles contained in these books are oriented toward a description of basic methodologies and model systems used in the exploration of the molecular bases of hormone action, and are aimed at a broad spectrum of readers including those who have not yet worked in the field as well as those who have considerable expertise in one or another aspect of hormone action. This book opens with a chapter on the physiological properties of the thyroid hormone receptors in the intact animal. This is followed by separate chapters on β -adrenergic receptors; the study of hormone-receptor interaction by measuring the biological responses induced by the actions of gonadotropins on Leydig cells; chemical and immunochemical properties of hCG and PMSG treated with glycosidases; and binding of follitropin (FSH) to rat testes. Subsequent chapters deal with the control of changes of gonadotropin responsiveness of the granulosa cell during follicular maturation;

regulation of prolactin receptors by steroid hormones; and the role of membrane protein phosphorylation in the effects of neurotransmitters. *Agricultural and Food Electroanalysis* offers a comprehensive rationale of electroanalysis, revealing its enormous potential in agricultural food analysis. A unique approach is used which fills a gap in the literature by bringing in applications to everyday problems. This timely text presents in-depth descriptions about different electrochemical techniques following their basic principles, instrumentation and main applications. Such techniques offer invaluable features such as inherent miniaturization, high sensitivity and selectivity, low cost, independence of sample turbidity, high compatibility with modern technologies such as microchips and biosensors, and the use of exciting nanomaterials such as nanoparticles, nanotubes and nanowires. Due to the advantages that modern electroanalytical techniques bring to food analysis, and the huge importance and emphasis given today to food quality and safety, this comprehensive work will be an essential read for professionals and researchers working in analytical laboratories and development departments, and a valuable guide for students studying for careers in food science, technology and chemistry.

The auditory system is a complex neural system composed of many types of neurons connected into networks. One feature that sets the auditory system apart from other sensory systems, such as somatosensory or visual systems, is the many stages of neural processing that occur between the ear in the periphery and the cerebral cortex. Each stage is composed of specialized types of neurons connected in specific microcircuits that perform computations on the information about sound. To understand this processing, all the tools of neuroscience must be employed. The proposed text integrates cell biology, synaptic physiology, and electrophysiology to fully develop the topic, presenting an overview of the functional anatomy of the central auditory system. It is organized based on the neuronal connectivity of the central auditory system, which emphasizes the neurons, their synaptic organization, and their formation of functional pathways and microcircuits. The goal of the book is to stimulate research into the cell biology of the central auditory system and the characteristics of the specific neurons and connections that are necessary for normal hearing. Future research on the development of the central auditory including that employing stem cells will require such

Annotation The International Conference on Calorimetry in Particle Physics has become the major forum for state-of-the-art developments of calorimetry techniques. The tenth conference was attended by about 150 physicists from 20 countries and covered all aspects of calorimetric particle detection and measurements, with emphasis on high energy physics experiments as well as experiments in nuclear physics and astrophysics. The proceedings contain three parts: introductory papers, contributed papers and a summary. The introductory papers start with a historical review of the development of calorimetry technology, and continue with overviews of the current status of calorimetry in high energy physics and astrophysics, which are followed by discussions on calorimetry in future accelerator facilities, such as linear colliders and the Super B Factory. A "hot" technology regarding the "energy flow concept" is also dealt with.

Cell Separation: Methods and Selected Application, Volume 3 provides information pertinent to the design and application of methods for the separation of cells. This book covers a variety of topics, including lymphoma cells, lectins, purification of cells from lung tumors, macrophage electrophoretic migration test, tissue heterogeneity, and characteristics of cultured cells. Organized into 13 chapters, this volume begins with an overview of the approaches in examining particular cell-surface properties and their role in the metastatic process. This text then examines lectins as important tools for identification and separation of cells, particularly of lymphocyte subpopulations. Other chapters consider the various methods that have been used to disperse rat pituitary tissue into single cells. This book discusses as well the different methods for isolating type II cells. The final chapter deals with the significance of

having cell cultures homogeneous for a given cell type. This book is a valuable resource for cell biologists, experimental oncologists, hematologists, immunologists, and endocrinologists. *Advances in Cell Biology* has been initiated as a continuing, multi-volume series to report on the progress of a wide spectrum of problems of cell structure and cell function. In arranging these volumes individual contributors are asked not only to review the major new information, but especially to present the state of a given problem or area by discussing the current central issues, speculations, concepts, hypotheses, and technical problems. We intend, in addition, that these volumes will not be concerned with comprehensive reviews of the recent literature but will consist rather of presentations of an interpretive and integrative nature, based on selection of major research advances. It is our aim that these volumes should provide the means whereby cell biologists may keep themselves reasonably well informed about the current progress in research areas in cell biology in which they are not immediately or directly involved themselves. The articles, nevertheless, are expected to bring into focus the experimental objectives of the specialists in a given research area.
