An *Introduction to Network Simulator NS2* is a beginners' guide for network simulator NS2, an open-source discrete event simulator designed mainly for networking research. NS2 has been widely accepted as a reliable simulation tool for computer communication networks both in academia and industry. This book will present two fundamental NS2 concepts: i) how objects (e.g., nodes, links, queues, etc.) are assembled to create a network and ii) how a packet flows from one object to another. Based on these concepts, this book will demonstrate through examples how new modules can be incorporated into NS2. The book will: -Give an overview on simulation and communication networks. -Provide general information (e.g., installation, key features, etc.) about NS2. -Demonstrate how to set up a simple network simulation scenario using Tcl scripting language. -

Explain how C++ and OTcl (Object oriented Tcl) are linked, and constitute NS2. -Show how Ns2 interprets a Tcl Script and executes it. - Suggest post simulation processing approaches and identify their pros and cons. -Present a number of NS2 extension examples. -Discuss how to incorporate MATLAB into NS2. Starting with the client-server model, this book attempts to integrate disparate topics of state-of-the-art telecommunications principles. Typically, data communications and telecommunications have been separated, but are linked here. Timing of computers and the problems of jitter are brought to bear, as is multiplexing and circuit- and packet-switching. Protocol architecture is discussed from a point of functions that then lend themselves to the “layering” concepts. Business and regulation issues, pertaining to the issues discussed, are included. The book integrates these concepts by illustrating how these disparate issues form the underpinnings of the World Wide Web. Unlike data communications of the past, today's networks consist of numerous devices that handle the data as it passes from the sender to the receiver. However, security concerns are frequently raised in circumstances where interconnected computers use a network not controlled by any one entity or organization. Introduction to Network Security exam
